### **Project Description: Bright TV Viewership Analysis**

This project focuses on analyzing the **Bright TV dataset** to gain valuable insights into television viewership and support data-driven decision-making. The dataset contains detailed information about viewer activity, including watch duration, viewing times, TV channels, and audience demographics, providing a comprehensive understanding of viewing behaviour and channel performance.

The primary objective of this project is to develop an interactive dashboard using **Google Looker Studio** and **Microsoft Excel** that transforms raw data into meaningful and easy-to-understand visualizations. The dashboard enables management to monitor key performance indicators (KPIs), identify trends, and evaluate how viewers interact with different TV channels over time.

The analysis examines overall viewing patterns, identifies the most-watched TV channels, highlights peak viewing hours, and compares viewing behaviour across weekdays, weekends, and different audience segments. It also explores demographic factors such as age, gender, and region to better understand the characteristics of the viewing audience.

Based on these findings, the dashboard provides actionable recommendations to improve content scheduling, optimize programming strategies, enhance audience engagement, and strengthen marketing efforts. By presenting insights through interactive reports and visualizations, the project empowers stakeholders to make informed decisions that improve operational performance and maximize television viewership.

Ultimately, this project demonstrates how business intelligence and data visualization can transform raw viewing data into strategic insights that support the growth and success of Bright TV.
